Design of Experiments (DOE) is also referred to as Designed Experiments or Experimental Design - all of the terms have the same meaning. Experimental design can be used at the point of greatest leverage to reduce design costs by speeding up the design process, reducing late engineering design changes, and reducing product material and labor ...

### **Design of Experiments (DOE) Tutorial - MoreSteam**

The question of design of experiments is: which experiment is better? The variance of the estimate  $X_1$  of  $\theta_1$  is  $\sigma^2$  if we use the first experiment. But if we use the second experiment, the variance of the estimate given above is  $\sigma^2/8$ . Thus the second experiment gives us 8 times as much precision for the estimate of a single item, and estimates all items simultaneously, with the same precision.

One aspect which is critical to the design is that they be "balanced". A balanced design has an equal number of levels represented for each KPIV. We can confirm this in the design on the right by adding up the number of + and - marks in each column. We see that in each case, they equal 4 + and 4-values, therefore the design is balanced.
