Expertise in community ecology within the department is focused on the two most diverse communities in the region: tropical forests and coral reefs. In both cases, research has benefitted from the presence of study sites with high diversity within Singapore itself, as well as collaborations throughout the region.

3. Biogeography and ecology converging. During recent years, shared technologies and approaches have provided biogeography and ecology an opportunity to converge upon topics of mutual interest and at spatial and temporal scales relevant to both disciplines (figure 1).The overlap between the disciplines is rapidly increasing, as evidenced by the faster growth of papers described by both ...

Biogeography and ecology: two views of one world

Biogeography. Biogeography is the study of the geographic distribution of living things and the abiotic factors that affect their distribution. Abiotic factors such as temperature and rainfall vary based mainly on latitude and elevation. As these abiotic factors change, the composition of plant and animal communities also changes.

The high residual variance (72%) indicated that the sum of other unexamined factors contributed the largest component of the variation observed in the kelp-associated diatom communities, and grazing and possible defence strategies utilised by kelps are proposed as processes playing an important role in the structuring of epiphytic diatom communities.

The biogeography of the Mojave involves the interaction of geography, ecology, and physiology as shaped by the temporal changes of geology and climatic conditions. The Mojave is a broad desert landscape, with complex topography, and a harsh and unforgiving climate, both of which have a dynamic history of change during the assembly of the flora and fauna that inhabit the region.

and present a synthesis of the ecology and biogeography of forests and woodlands of the Uinta Mountains. The discussion will be from two perspectives: (1) the geographic and elevational distributions of individual species, and (2) vegetation zonation, or the patterns of dominant forest types as controlled by elevation, latitude, and other factors.

Ongoing research projects in the Conservation Biogeography Lab include:. EcoSpy: Leveraging the potential of historical spy satellite photography for ecology and conservation . In EcoSpy we pioneer the broad-scale use of recently declassified historical, global, high-resolution spy satellite photographs from the Cold War era (Corona) to extend the temporal scale of ecological and conservation ...

Complementarity maps for all marine mammal species show a gradient of increasing importance from pelagic towards coastal areas, with patches of high priority in the Southern, North Pacific, and Arctic Oceans. Conversely, maps depicting hotspots of richness (HRs) of marine mammals show that HRs are highly biased towards tropical zones.

Indeed, one could argue that ecologists further weakened the study of biogeography through the development of the equilibrium theory of island biogeography, which was essentially non-historical [5,6], and with hypotheses to explain variation in species richness by local, primarily ecological, mechanisms [7-9], and, more recently, the promotion of stochastic mechanisms lacking ecology ...
