There are two technologies that separate modern steam locomotives from traditional locomotives: the implementation of the Gas Producer Combustion System (GPCS) in place of conventional steam locomotive combustion (which works in tandem with a high efficiency exhaust) and the use of a modern and much more effective internal boiler water treatment regime than was available during the US steam era, (PT).

Steam engines work by using the expansion of high-pressure steam to push against moving pistons in the cylinders of reciprocating engines, or against the moving vanes of steam turbines.

### **Steam Engineering Basics - John Forester**

According to a proposal for modern boilers water must be fed into the boiler using a feed pump. The feed pump must be belt driven, taking water from the source tanks. This water is then heated by passing it through the exhaust steam chamber and its entry into the boiler is

Modern steam power is a little known or understood subject. In contrast to almost all other steam information on the internet, this information is scientifically correct. Therefore it will not offer Tesla turbines, free energy from burning water, or any of the many types of goofy rotary engines that the fertile human mind has invented.

The percentage of total heat exported by outlet steam in the total heat supplied by the fuel (coal) is called steam boiler efficiency. It includes with thermal efficiency, combustion efficiency and fuel to steam efficiency. Steam boiler efficiency depends upon the size of boiler used. A typical efficiency of steam boiler is 80% to 88%.

STEAM is an acronym for Science,  
Technology, Engineering, Arts, and  
Mathematics. This publication features  
the bridges between Science,  
Technology, Engineering Mathematics  
(STEM) and the Arts. In this context, the  
journal acts as a forum for open dialogue  
of STEAM as well as expanding the body  
of transdisciplinary knowledge.
