Mutual Impedance In Parallel Lines

Abstract—When two or more lines are running parallel to each other, mutual impedances between the lines modify the voltage and current profile measured in the protective relays protecting each line. Analysis of transmission line impedance formulas can provide interesting data to the protection engineer.

In this equation, $K_{m1} = Z_{m0}(1-2) / 3Z_{11}$, which means the mutual factor K_{m1} is the zero sequence mutual impedance between the protected line and the first parallel line ($Z_{m0}(1-2)$) divided by 3 times the positive sequence impedance of the protected line 1.

Parallel Line Mutual Coupling Compensation

With aiding magnetically coupled inductors, the total inductance of the parallel-connected coils is higher than the inductance of the coils that have zero mutual inductance. Similarly, for opposing coils, the total inductance is lower than the inductance of the coils that have zero mutual inductance. This graph shows several examples of total inductance of the two mutually coupled aiding inductors connected in parallel as a function of the coupling coefficient k for different L_1 and L_2 .

negative mutual sequence impedance can be neglected and the zero sequence mutual impedance must be considered. Mutual impedance represents a logarithmic relationship and therefore the slowly decrease with increasing distance between the lines is notable. Even if the distance between the lines is notable, mutuality still persists.

A. Self and Mutual Impedances The characterization of the self and mutual impedances of transmission lines is a topic widely discussed in [3], [4], and [5]. In a paper published in 1926 [4], Dr. John Carson derived the widely accepted equations describing the electromagnetic wave propagation in electrical conductors with a returning

Cases with and without compensation for the mutual impedance of the parallel line are considered, as well as cases with and without adaptive change of relay settings. In general, the results are highly dependent on the connection of the parallel line. System impedances have more influence on the results than the pre-fault load flow.

LINE & CABLE PARAMETER CALCULATION

Mutual inductance; Any capacitive reactances; For now we can ignore wavelength as it pertains to cable length as my specific question pertains to frequencies less than 100kHz and wire lengths less than 100m so these effects can be ignored. The copper wires are parallel to each other, like zip cord.

How to calculate total impedance of two parallel ...

By definition two parallel lines have a full compliment of sequence mutual impedances. In general the only one of these sequence mutuals that is used for anything is the zero sequence mutual between the lines, but there are all possible combinations including between different sequences of the same line.

Zero sequence mutual impedance for underground cables ...

The zero-sequence mutual impedance may be as high as 70% of the zero-sequence self-impedance when the parallel lines are on the same tower. Therefore, zero-sequence mutual coupling has a considerable effect on ground faults and on ground fault relaying.

Calculation of Total Current and Total Impedance There are two strategies for calculating the total current and total impedance. First, we could

calculate total impedance from all the individual impedances in parallel ($Z_{\text{Total}} = 1 / (1/Z_R + 1/Z_L + 1/Z_C)$), and then calculate total current by dividing source voltage by total impedance ($I=E/Z$).
