Placing of events in the order in which they occurred without any relationship to the actual time during which any one event occurred is known as relative dating. It is a qualitative way of describing the sequence of events.

For example, the principle of superposition states that sedimentary layers are deposited in sequence, and, unless the entire sequence has been turned over by tectonic processes or disrupted by faulting, the layers at the bottom are older than those at the top.

Relative age dating simply describes the age of something relative to other things. So a rock layer that has layers above and below it is older than the layers above it and younger than the layers below it.

Absolute age dating describes the age of something in exact units, like years. It is more specific than relative age dating.

Relative dating principle. In any sequence of undeformed sedimentary rocks (or laval flows), the oldest rock is always at the bottom, and the youngest is at the top. Therefore, each layer of rock represents an interval of time that is more recent than that of the underlying rocks.
