A colloid is intermediate between a solution and a suspension. While a suspension will separate out a colloid will not. Colloids can be distinguished from solutions using the Tyndall effect. Light passing through a colloidal dispersion, such as smoky or foggy air, will be reflected by the larger particles and the light beam will be visible.

### Solutions, Suspensions, Colloids -- Summary Table

True solutions are the type of mixtures, where the solute and solvents are properly mixed in the liquid phase. Colloidal solutions are the type of mixture, where the solute (tiny particles or colloids) is uniformly distributed in the solvent (liquid phase). The suspension is the mixture, where the solute does not get dissolved, rather get suspended in the liquid and float freely in the medium.

more: suspensions are heterogeneous when the particles separate from the solvent. "A colloid is a substance microscopically dispersed evenly throughout another substance" (wikipedia) So a suspension is heterogeneous but a colloid is a homogeneous. A solution is also homogeneous as long as it is unsaturated. 4 comments.
