volume the explanations which have become generally accepted for the chemical and physical properties, dyeing, printing and chemical finishing of textile fibres.

Textile Science: An Explanation of Fibre Properties by Gohl

A textile is a flexible material made by creating an interlocking network of yarns or threads, which are produced by spinning raw fibres into long and twisted lengths. Textiles are then formed by weaving, knitting, crocheting, knotting, tatting, felting, bonding or braiding these yarns together. The related words "fabric" and "cloth" and "material" are often used in textile assembly trades as synonyms for textile. However, there are subtle differences in these terms in specialized ...

Textile Science. Textile Science integrates the development, acquisition, distribution and utilization of textiles. This option brings together the study of basic sciences and technologies, application of management principles, the perspective of history as well as the fine art of design in a rich, challenging learning environment.

Textile Science | College of Education and Human Sciences

The word “textile” was originally used to define a woven fabric and the processes involved in weaving. Textile refers to any material made of interlacing fibers or Yarns. The yarn is produced by spinning raw fibers of wool, flax, cotton, or other material to produce long strands. Textiles are formed by weaving, knitting, crocheting, knotting, or pressing fibers together (felt).
