The Etiology Of Fowl Paralysis

Biely and Palmer review the literature of the last 15 years, which deals with the causative organism of fowl paralysis.

Pathologically the disease is characterized by tumour-like growths on the peripheral nerves and by an encephalo-myelitis. In the earlier literature helminths or coccidia were generally considered as being the causative organisms.

Observations on the etiology and control of fowl paralysis.

Fowl Paralysis: A viral disease that affects poultry - it is very contagious and is a herpes virus. The virus tends to affect the nerves and cause tumors in internal organs. Poultry may be unable to lay eggs or may even die. Young birds are more susceptible than older birds with death most common between the ages of 8 and 20 weeks.

Oddly enough, but the causes of this phenomenon can be very much. First, let's say that the failure of the limbs or their paralysis is a complete lack of movement and is medically caused by a lesion of the nervous system. But already this defeat may be caused by different circumstances. Let's talk about them in more detail.

Chicken Paralyzed Questions - Raising Chickens

Calcium or Phosphorus deficiency is one of 7 causes of paralyzed in chicken legs. We all know that both calcium and phosphorus are supplements for the bones. It's also true for birds, not to mention chicken. Aside of playing roles in synthesis of bones, these substances are also useful for nervous system, blood clotting, and muscle contraction.
