Tribology is the science and technology that investigates the interaction of surfaces in relative motion in the form of friction, wear, lubrication and other design aspects of materials science. These concepts of tribology have several practical implications in our everyday lives. For example, the friction between our feet and the ground allows us to walk and drive each day.

Tribology, the study of the interaction of sliding surfaces. It includes three subjects: friction, wear, and lubrication (qq.v.). There is a difficulty in that friction is generally characterized as a branch of physics or mechanical engineering, wear is part of the material science of metallurgy, while lubrication is a branch of chemistry.

### **Tribology | physics | Britannica**

Wear might have different patterns corresponding to various wear mechanisms. A surface can be subject to more than one wear mechanism simultaneously. The process of wear can change continuously in time or with changes in operational conditions. Wear is usually accelerated by the frictional heating by means of chemical and mechanical interactions.
