propeller. In its simplest form a turboprop consists of an intake, compressor, combustor, turbine, and a propelling nozzle. Air is drawn into the intake and compressed by the compressor. Fuel is then added to the compressed air in the combustor, where the fuel-air mixture then combusts. The hot combustion gases expand through the

propeller engines develop thrust by moving a large mass of air through a small change in velocity. Propellers are very efficient and can use nearly any kind of engine to turn the prop (including humans!).

A first in turboprops in 2018, GE Aviation offers enhanced electronic engine and propeller control (EEPC) on its H-Series engines. Initially found on Thrush Aircraft's 510G and Nextant's G90XT, the EEPC-enabled engine provides pilots a simplified flying experience by utilizing single-lever power controls that integrate propeller and engine

A turboprop engine turns this on its head; almost all of the energy is harnessed to turn the propeller shaft at the front, and only about ten per cent of the thrust comes from the exhaust gas. The propellers are much larger than the diameter of the jet engine, so most of the
